J - RANGE

Forced Draft Dry Cooler

The New J - Range of Forced Draft Dry Coolers offers a welcome expansion to the EVAPCO Air Solutions product line. Also available in both horizontal or vertical orientation

Standard induced draft dry coolers require leaving air temperatures below 70 deg C to ensure motor longevity and prevent motor overheating.

The forced draft arrangement inherently allows for the lower ambient air temperature to pass over the motor preventing overheating whilst increasing the air mass flow rate, thus improving thermal performance.

The New J - Range is available with the FlexShield Corrosion Protection System array of material choices
